Description

Grape seed extract gets produced from the seed of white grapes. Through an elaborate process, the ingredients are extracted from the seed and then concentrated until an OPC content of 95% is reached.

OPC stands for "Oligomere Proantho Cyanidins". These are secondary plant compounds which belong to the group of flavonoids. They were first discovered in 1948 by Jaques Masquelier. OPC have become increasingly popular in recent years.

They are one of the most powerful antioxidants which have the ability to bind and neutralize free radicals in the body. One of the most popular applications is as an anti age product.

The grapes which are used to produce the OPC we use grow in an area far away from any pollution.
